

CMMC Compliance Success - Vibrint's Microsoft Government Cloud Migration

Daymark's customer, Vibrint, a key player in the DIB, needed to enhance their cybersecurity to meet CMMC 2.13 Level 2 compliance and adhere to ITAR. The environment was complex due to an acquisition that resided in a Commercial M365 tenant and their antiquated on-prem email platform. With an aggressive timeline, Daymark migrated Microsoft

GCC High and on-premises workloads to the Azure Government cloud as well as Azure Virtual Desktop infrastructure for enclave user access to sensitive data. The strategy ensured CMMC and ITAR compliance, streamlined operations and provided robust security and efficiency to protect sensitive data.

Products and services: GCCH Migration

Daymark Solutions, Vibrint, and GCC High

Customer challenges

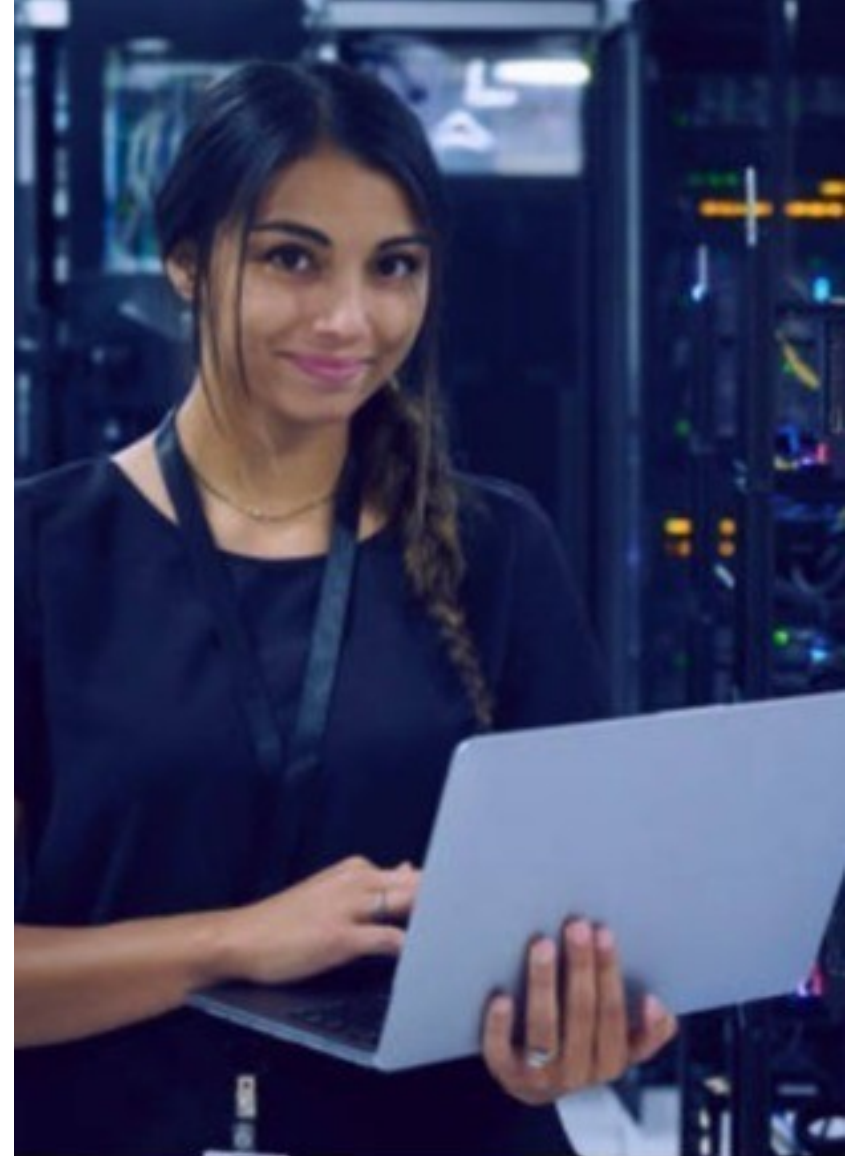

Vibrint needed to expedite CMMC compliance by moving their on-prem environment and partner Commercial M365 tenant to GCC High and Azure Government Cloud. With a recent merger and urgent deadline, they required a solution to support the entire company and provide access for new employees on day one. Daymark Solutions met the customer's aggressive timelines and orchestrated secure migration and adoption in preparation for a future CMMC 2.13 L2 assessment.

Partner solutions

Daymark Solutions migrated the client directly into GCC High using native Microsoft hybrid email migration methodology and 3rd party tenant-to-tenant migration tools. Using Microsoft Purview, Daymark enhanced compliance control tracking and regulatory functionality within Microsoft 365 and Azure Government Cloud. Azure Virtual Desktop was deployed to meet immediate day-one employee access requirements, secure data and applications, and manage M365 access.

Customer benefits

The complete migration of users, email, data, and endpoints into a single, secure, and compliant Microsoft 365 enclave and Azure landing zone enabled Vibrint to leverage the capabilities of Microsoft 365 and Azure stacks, administer resources, manage compliance and vulnerabilities, secure access control through a unified platform, and eliminate 3rd-party disjointed solutions. Vibrint's staff can now quickly act upon onboarding business processes.

The secure Azure landing zone is configured with Microsoft and regulatory best practices, ready for workloads, and equipped with compliance policies, ensuring optimal security and efficiency.

The Microsoft 365 tenant is configured to protect intellectual property. Tenant configurations and policies align with CMMC controls, and GRC management is through Microsoft Purview and Defender.

Migrating fragmented on-premises and commercial cloud systems to Microsoft GCC High and Azure Government Cloud enables the IT team to focus on high-priority initiatives and safeguard sensitive data.
